

Durabase Radon Specification

Durabase does not supply, install, or accept responsibility for the radon barrier system. Responsibility for its specification, detailing, installation, and performance rests solely with the appointed designer and installer.

Where radon protection is required, the Durabase system may be used in conjunction with a suitable radon barrier, which must be installed fully in accordance with the membrane manufacturer's instructions and applicable building regulations.

Any cross-sectional detail provided is for illustrative purposes only. The membrane must be installed beneath the walls and correctly chased into the structure to ensure continuous coverage. All laps, joints, penetrations, and terminations must be formed and sealed strictly in accordance with the manufacturer's guidelines.
